COVID 19 Analysis

Tyler Kephart

2024-08-19

Required Packages

```
library(tidyverse)
library(lubridate)
library(usmap)
```

Part 1 - Basic Exploration of US Data

The New York Times (the Times) has aggregated reported COVID-19 data from state and local governments and health departments since 2020 and provides public access through a repository on GitHub. One of the data sets provided by the Times is county-level data for cumulative cases and deaths each day. This will be your primary data set for the first two parts of your analysis.

County-level COVID data from 2020, 2021, and 2022 has been imported below. Each row of data reports the cumulative number of cases and deaths for a specific county each day. A FIPS code, a standard geographic identifier, is also provided which you will use in Part 2 to construct a map visualization at the county level for a state.

Additionally, county-level population estimates reported by the US Census Bureau has been imported as well. You will use these estimates to calculate statistics per 100,000 people.

```
# Import New York Times COVID-19 data
# Import Population Estimates from US Census Bureau

us_counties_2020 <- read_csv(
    "https://raw.githubusercontent.com/nytimes/covid-19-data/master/us-counties-2020.csv")
us_counties_2021 <- read_csv(
    "https://raw.githubusercontent.com/nytimes/covid-19-data/master/us-counties-2021.csv")
us_counties_2022 <- read_csv(
    "https://raw.githubusercontent.com/nytimes/covid-19-data/master/us-counties-2022.csv")
us_population_estimates <- read_csv("fips_population_estimates.csv")</pre>
```

Question 1

Your first task is to combine and tidy the 2020, 2021, and 2022 COVID data sets and find the total deaths and cases for each day since March 15, 2020 (2020-03-15). The data sets provided from the NY Times also includes statistics from Puerto Rico, a US territory. You may remove these observations from the data as they will not be needed for your analysis. Once you have tidied the data, find the total COVID-19 cases and deaths since March 15, 2020. Write a sentence or two after the code block communicating your results. Use inline code to include the max_date, us_total_cases, and us_total_deaths variables. To write inline code use r.

```
us counties 2021,
                     us_counties_2022,
                     deparse.level = 1) %>%
                # exclude Puerto Rico, idk why other territories get to stay
                filter(state != "Puerto Rico",
                        # filter from March 15, 2020 and after
                        date \geq as.Date("2020-03-15"))
# summarize total cases and deaths by date
daily_totals <- us_counties %>%
                     group_by(date) %>%
                     summarise(total_deaths = sum(deaths),
                               total_cases = sum(cases))

# ... with 647 more rows
```

As of December 31, 2022, there was more than 99.37 million cases and 1.09 million deaths from COVID-19 in the United States (excluding Puerto Rico).

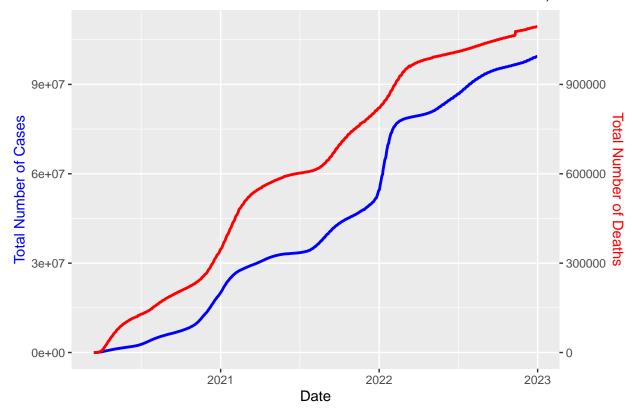

Question 2

Create a visualization for the total number of deaths and cases in the US since March 15, 2020. Before you create your visualization, review the types of plots you can create using the ggplot2 library and think about which plots would be

effective in communicating your results. After you have created your visualization, write a few sentences describing your visualization. How could the plot be interpreted? Could it be misleading?

```
# plot for the total number of US cases and deaths since March 15, 2020
ggplot(daily_totals, aes(x = date)) +
   geom_line(aes(y = total_cases, color = "Cases"), linewidth = 1) +
   # scaling deaths for visibility
   geom_line(aes(y = total_deaths * 100, color = "Deaths"), linewidth = 1) +
   # set up y axis for 2 variables
   scale_y_continuous(name = "Total Number of Cases",
                       # add second axis for deaths
                       sec.axis = sec_axis(~./100, name = "Total Number of Deaths")) +
   # color the y axis titles to match the plotted lines
   theme(axis.title.y.left = element_text(color = "blue"),
         axis.title.y.right = element text(color = "red")) +
   labs(title = "Total COVID-19 Cases and Deaths in the US Since March 15, 2020",
       x = "Date") +
   # remove legend name
   theme(legend.position = "none") +
   scale_color_manual(values = c("Cases" = "blue", "Deaths" = "red"))
```

Total COVID-19 Cases and Deaths in the US Since March 15, 2020

There seems to have been a spike in cases early 2022 that was possibly due to increased travel during the holiday season in the United States.

Question 3

While it is important to know the total deaths and cases throughout the COVID-19 pandemic, it is also important for local and state health officials to know the the number of new cases and deaths each day to understand how rapidly the virus is spreading. Using the table you created in Question 1, calculate the number of new deaths and cases each day and a seven-day average of new deaths and cases. Once you have organized your data, find the days that saw the largest number of new cases and deaths. Write a sentence or two after the code block communicating your results.

```
daily_7day_avg <- daily_totals %>%
    mutate(
        delta_deaths_1 = total_deaths - lag(total_deaths),
        delta_cases_1 = total_cases - lag(total_cases))
# calculate rolling averages
calculate_rolling_average <- function(x, window_size) {</pre>
    sapply(seq_along(x), function(i) {
        if (i < window_size) return(NA)</pre>
        mean(x[(i - window_size + 1):i])
    })
}
# add 7-day rolling averages
daily_7day_avg <- daily_7day_avg %>%
    mutate(
        delta_deaths_7 = calculate_rolling_average(delta_deaths_1, 7),
        delta_cases_7 = calculate_rolling_average(delta_cases_1, 7)
daily_7day_avg
## # A tibble: 1,022 x 7

# ... with 803 more rows
```

As of December 31, 2022, the most amount of new cases in a single day happened on January 10, 2022 with 1.427097×10^6 cases. The most amount of new deaths in a single day happened on November 11, 2022 with 1.0037×10^4 deaths.

Question 4

Create a new table, based on the table from Question 3, and calculate the number of new deaths and cases per 100,000 people each day and a seven day average of new deaths and cases per 100,000 people.

```
# aggregate US population by year
us_population_totals <- us_population_estimates %>%
    group_by(Year) %>%
    summarize(total_population = sum(Estimate))
# add year to daily_totals
daily_7day_avg_yr <- daily_7day_avg %>%
   mutate(year = year(date))
# join with population totals
daily_7day_avg_yr_pop <- daily_7day_avg_yr %>%
    left_join(us_population_totals, by = c("year" = "Year"))
# calculate metrics per 100,000 people
daily_7day_avg_per_100k <- daily_7day_avg_yr_pop %>%
   mutate(
        total_deaths = (total_deaths / total_population) * 100000,
        total_cases = (total_cases / total_population) * 100000,
        delta_deaths_1 = (delta_deaths_1 / total_population) * 100000,
        delta_cases_1 = (delta_cases_1 / total_population) * 100000,
        delta_deaths_7 = calculate_rolling_average(delta_deaths_1, 7),
        delta_cases_7 = calculate_rolling_average(delta_cases_1, 7)
   ) %>%
    select (date,
            total_deaths,
            total_cases,
            delta_deaths_1,
            delta cases 1,
            delta_deaths_7,
            delta_cases_7)
daily_7day_avg_per_100k
```

                                                                                                    2.07
```

0.0196

1.69

The increasing values for delta_deaths_1 and delta_cases_1 suggest a rising trend in both metrics, which is further confirmed by the increasing delta_deaths_7 and delta_cases_7. This type of data can be useful for understanding the progression of the pandemic and the effectiveness of interventions over time.

Question 5

6 2020-03-20

0.0836

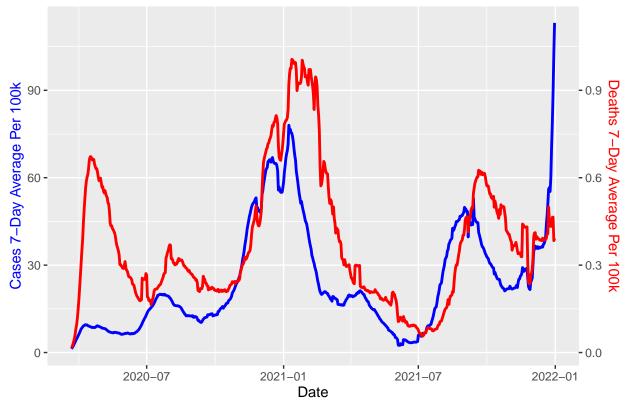

5.43

##

Create a visualization to compare the seven-day average cases and deaths per 100,000 people.

```
# compare 7-day average cases and deaths per 100k people
daily_7day_avg_per_100k %>% filter(!is.na(delta_cases_7)) %>%
   ggplot(aes(x = date)) +
    geom_line(aes(y = delta_cases_7, color = "Cases"), linewidth = 1) +
    # scale for visibility
    geom_line(aes(y = delta_deaths_7 * 100, color = "Deaths"), linewidth = 1) +
    # set up y axis for 2 variables
    scale_y_continuous(name = "Cases 7-Day Average Per 100k",
                       # add second axis for deaths
                       sec.axis = sec_axis(~./100, name = "Deaths 7-Day Average Per 100k")) +
    # color the y axis titles to match the plotted lines
    theme(axis.title.y.left = element_text(color = "blue"),
          axis.title.y.right = element_text(color = "red")) +
    labs(title = "7-Day Average of Cases and Deaths per 100,000 People",
         x = "Date") +
    # remove legend name
    theme(legend.position = "none") +
    scale_color_manual(values = c("Cases" = "blue", "Deaths" = "red"))
```

The plot really highlights the increased rates of cases and deaths around January 2021.

Part 2 - US State Comparison

While understanding the trends on a national level can be helpful in understanding how COVID-19 impacted the United States, it is important to remember that the virus arrived in the United States at different times. For the next part of your analysis, you will begin to look at COVID related deaths and cases at the state and county-levels.

Question 1

Your first task in Part 2 is to determine the top 10 states in terms of total deaths and cases between March 15, 2020, and December 31, 2021.

Once you have both lists, briefly describe your methodology and your results.

Determine the top 10 states in terms of total deaths and cases between March 15, 2020, and December 31, 202

```

Question 3

Now, select a state and calculate the seven-day averages for new cases and deaths per 100,000 people. Once you have calculated the averages, create a visualization using ggplot2 to represent the data.

Select a state and then filter by state and date range your data from Question 1. Calculate the seven-day of

```

Question 5

Modify the code below for the map projection to plot county-level deaths and cases per 100,000 people for your state.

```
# Copy and modify the code below for your state.
#
# plot_usmap arguments:
```

```
# regions: can be one of ("states", "state", "counties", "county"). The default is "states"
# include: The regions to include in the resulting map. If regions is "states"/"state", the value can be end ata: values to plot on the map
# values: the name of the column that contains the values to be associated with a given region.
# color: the map outline color.
# Reference the plot_usmap documentation for further information using ?plot_usmap
# plot_usmap(regions = "county", include="CO", data = colorado_county, values = "total_deaths", color = "blue"
# scale_fill_continuous(low = "white", high = "blue", name = "Deaths per 100,000")
```

Question 6

Finally, select three other states and calculate the seven-day averages for new deaths and cases per 100,000 people for between March 15, 2020, and December 31, 2021.

- Communicate your methodology, results, and interpretation here -

Question 7

Create a visualization comparing the seven-day averages for new deaths and cases per 100,000 people for the four states you selected.

- Communicate your methodology, results, and interpretation here -

Part 3 - Global Comparison

```
# Import global COVID-19 statistics aggregated by the Center for Systems Science and Engineering (CSSE) at Journal of Systems Import global population estimates from the World Bank.

#csse_global_deaths <- read_csv("https://raw.githubusercontent.com/CSSEGISandData/COVID-19/master/csse_covid_1#csse_global_cases <- read_csv("https://raw.githubusercontent.com/CSSEGISandData/COVID-19/master/csse_covid_19_deaths <- read_csv("https://raw.githubusercontent.com/CSSEGISandData/COVID-19/master/csse_covid_19_deaths_cases <- read_csv("https://raw.githubusercontent.com/CSSEGISandData/COVID-19/master/csse_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_cases_covid_19_deaths_c
```

Question 1

Using the state you selected in Part 2 Question 2 compare the daily number of cases and deaths reported from the CSSE and NY Times.

```
# To compare your state data between the two data sets, you will first need to tidy the US CSSE death and cas
# Hint: Review the documentation for pivot_longer().

# Once you have tidied your data, join the two CSSE US data sets to include cases and deaths in one table.

# Finally, create two visualizations with one plotting the CSSE and NY Times cases and the other plotting the
```

```
# Your tidied CSSE data for your selected state should look similar to the following tibble:
#
# A tibble: 43,362 × 6
#
     fips county state
                                date

Question 2

Now that you have verified the data reported from the CSSE and NY Times are similar, combine the global and US CSSE data sets and identify the top 10 countries in terms of deaths and cases per 100,000 people between March 15, 2020, and December 31, 2021.

```
# First, combine and tidy the CSSE death and cases data sets. You may wish to keep the two sets separate.

# Then, tidy the global population estimates. While tidying your data, remember to include columns that you w
# You will notice that the population estimates data does not include every country reported in the CSSE data
```

- Communicate your methodology, results, and interpretation here -

Question 3

Construct a visualization plotting the 10 countries in terms of deaths and cases per 100,000 people between March 15, 2020, and December 31, 2021. In designing your visualization keep the number of data you will be plotting in mind. You may wish to create two separate visualizations, one for deaths and another for cases.

- Communicate your methodology, results, and interpretation here -

Question 4

Finally, select four countries from one continent and create visualizations for the daily number of confirmed cases per 100,000 and the daily number of deaths per 100,000 people between March 15, 2020, and December 31, 2021.

- Communicate your methodology, results, and interpretation here -
